The Rural New-Yorker Packages

Since 1958 the Maritime Administration has continuously conducted instructions in use of collision avoidance radar for qualified U.S. seafaring personnel and representatives of interested Federal and State Agencies. Beginning in 1963, to facilitate the expansion of training capabilities and at the same time to provide the most modern techniques in training methods, radar simulators were installed in Maritime Administration's three region schools. It soon became apparent that to properly instruct the trainees, even with the advanced equipment, a standardize up-to-date instruction manual was needed. The first manual was later revised to serve both as a classroom textbook and as an onboard reference handbook. This newly updated manual, the fourth revision, in keeping with Maritime Administration policy, has been restructured to include improved and more effective methods of plotting techniques for use in Ocean, Great Lakes, Coastwise and Inland Waters navigation. The Field Guide to John Deere Tractors Gale / Cengage Learning

Tractors, unique in their uses, have undergone thousands of changes over the years to become one of the most handy machines one can have, in any form. There have been so many amazing discoveries and inventions in the history of mankind that it would be difficult to place them in order of importance. Many have revolutionized the way society works, and this could also be said of the humble tractor. Without it, it would be impossible to produce the vast amounts of food required by society today, and for this reason alone it must qualify as a small but essential cog in the vast machine that is the modern world. The earliest pioneer machines used steam traction rather than the new-fangled internal combustion engines, but technological break-throughs came thick and fast: diesel engines, Harry Ferguson's revolutionary three-point-hitch, sophisticated hydraulics, and the wonders of electronics in our own time. Henry Ford made tractors that small farmers could afford, International Harvester pioneered the 1920s Farmall - the first tractor able to cope with row crops - while Allis-Chalmers introduced pneumatic rubber tires in the 1930s. Nearly 30 years later the Steiger brothers invented an entirely new breed, the giant four-wheel-drive articulated super-tractor. This book covers more than a century of tractor-making and features tractors that are regarded with something like affection - Case, Fordson, Massey-Ferguson, Minneapolis-Moline, Versatile - they are all here and many others. Tractors of all shapes, sizes, ages, colors and types - they are here in all their resplendent glory.

Forthcoming Books

The U.S. Department of Energy (DOE) and the U.S. Department of Agriculture (USDA) are both strongly committed to expanding the role of biomass as an energy source. In particular, they support biomass fuels and products as a way to reduce the need for oil and gas imports; to

support the growth of agriculture, forestry, and rural economies; and to foster major new domestic industries-- biorefineries--making a variety of fuels, chemicals, and other products. As part of this effort, the Biomass R AND D Technical Advisory Committee, a panel established by the Congress to guide the future direction of federally funded biomass R AND D, envisioned a 30 percent replacement of the current U.S. petroleum consumption with biofuels by 2030. Biomass--all plant and plant-derived materials including animal manure, not just starch, sugar, oil crops already used for food and energy--has great potential to provide renewable energy for America's future. Biomass recently surpassed hydropower as the largest domestic source of renewable energy and currently provides over 3 percent of the total energy consumption in the United States. In addition to the many benefits common to renewable energy, biomass is particularly attractive because it is the only current renewable source of liquid transportation fuel. This, of course, makes it invaluable in reducing oil imports--one of our most pressing energy needs. A key question, however, is how large a role could biomass play in responding to the nation's energy demands. Assuming that economic and financial policies and advances in conversion technologies make biomass fuels and products more economically viable, could the biorefinery industry be large enough to have a significant impact on energy supply and oil imports? Any and all contributions are certainly needed, but would the biomass potential be sufficiently large to justify the necessary capital replacements in the fuels and automobile sectors?
