The neurologic examination is often viewed as a daunting monstrosity, byzantine in nature, complex to teach and cumbersome to learn. However, neurologic conditions are not uncommon in GP and hospital practice, and a grounded understanding of pertinent neurologic symptoms, signs and conditions is absolutely vital. This book serves to demystify the seemingly convoluted processes behind the neurologic examination, with chapters focussing on bringing the reader back to the basics, breaking complicated techniques down into its individual steps, supplemented by clear and concise explanation of neurologic principles. The book discusses neurologic signs and symptoms commonly encountered in our daily practice, with flow-charts, pictures and tables to help the reader learn, shape and build a solid foundation in neurology. Tips from examiner and specific case examples are included to improve the reader's grasp of the topics. This easy-to-read guidebook is essential for all medical students and physicians seeking to prepare for their professional examinations, to improve on their care of our patients, or simply to understand the wonderful inner-workings of neurology a little better. Well written textbooks which focus on neurologic examination and written in a palatable manner for the non-neurologist, are rare and few. They are often admixed with other non-neurologic topics (e.g. respiratory, cardiac or abdominal examination), with superficial and cursory discussion of neurologic conditions. At the other end of the spectrum, neurology textbooks are often written in a manner better suited to neurologists than to non-neurologists, struggling to better understand the basic concepts. In my years of teaching students from all 3 local medical schools studying for their undergraduate medical degrees, and medical officers preparing for the MRCP PACES examination, a common problem they encountered was the lack of a palatable yet informative neurologic text which helps them understand the concepts without murdering their interest in the topic. I believe this book serves to fill that gap, and to hopefully better prepare our doctors in their careers, and to nurture their love and interest in this subject I so love.

*Physical Examination for Surgeons* Oxford University Press, USA

Obtaining the patient's history is the most important part of a neurological examination, provided that the patient's level of consciousness is normal. By carefully listening to the patient, and asking questions, unnecessary further tests can usually be eliminated. If the findings in a basic neurological examination are normal, a significant portion of neurological conditions can be excluded with high probability. A neurological examination involves an assessment of both the patient's general status (higher mental functions) (not discussed in detail in this article) as well as the neurological status. The examination should always be

carried out in the same logical order so as to minimise the possibility of omitting a part of it, for example after being distracted by the patient's questions. All findings should be documented immediately since it can be surprisingly difficult to remember afterwards, for example, which side was affected by a symptom. The neurological status helps to establish an anatomical diagnosis, i.e. do the symptoms originate from the brain spinal cord peripheral nervous system neuromuscular system or muscles? After the anatomical diagnosis has been made, the examination is focused towards localising more closely the origins of the symptoms within the central or peripheral nervous system. At this stage, particular attention is paid to any neurological asymmetry between sides in the upper and lower extremities.

Bedside Neurological examination is an important tool in diagnosing neurological disorders. Despite significant advances in the investigations available for diagnosing neurological disorders bedside neurological examination remains the cornerstone in diagnosing neurological disorders and should not only be conducted prior to the investigations but should be actually be utilized to plan the appropriate investigations. The book provides a focused account of various aspects of the neurological examination leading to clinical localisation and hence obtaining the neurological diagnosis. It includes topics like 'how to obtain a appropriate neurological history', 'higher mental system examination', examination of speech and various cranial nerves and examination of other systems including motor system, sensory system, reflexes, cerebellar and autonomic nervous system. The book also includes certain interesting topics like 'neurological examination of the unconscious patient' and 'tricks and tips of neurological localisation'. The book is easy to read and memorize due to multiple self explanatory illustrations and important aspects being highlighted in bulleted format. The book will be of extreme help for MD and DNB students of Internal Medicine as well as DM and DNB students of Neurology and DNB and MCH Neurosurgery students, hence covering a fairly large readership base. It will also be read by practising Internal medicine physicians, neurologists and neurosurgeons who may want to revise the basics and tricks of neurological examination and localization.

The ESC Textbook of Intensive and Acute Cardiovascular Care is the official textbook of the Acute Cardiovascular Care Association (ACVC) of the ESC. Cardiovascular diseases (CVDs) are a major cause of premature death worldwide and a cause of loss of disability-adjusted life years. For most types of CVD early diagnosis and intervention are independent drivers of patient outcome. Clinicians must be properly trained and centres appropriately equipped in order to deal with these critically ill cardiac patients. This new updated edition of the textbook continues to comprehensively approach all the different issues relating to intensive and acute cardiovascular care and addresses all those involved in intensive and acute cardiac care, not only cardiologists but also critical care specialists, emergency physicians and healthcare professionals. The chapters cover the various acute cardiovascular diseases that need high quality intensive treatment as well as organisational issues, cooperation among professionals, and interaction with other specialities in medicine. SECTION 1 focusses on the definition, structure, organisation and function of ICCU's, ethical issues and quality of care. SECTION 2 addresses the pre-hospital and immediate in-hospital (ED) emergency cardiac care. SECTIONS 3-5 discuss patient monitoring, diagnosis and specific procedures. Acute coronary syndromes (ACS), acute decompensated heart failure (ADHF), and serious arrhythmias form SECTIONS 6-8. The main other cardiovascular acute conditions are grouped in SECTION 9. Finally SECTION 10 is dedicated to the many concomitant acute non-cardiovascular conditions that contribute to the patients' case mix in ICCU. This edition includes new chapters such as low cardiac output states and cardiogenic shock, and pacemaker and ICDs: troubleshooting and chapters have been extensively revised.

Purchasers of the print edition will also receive an access code to access the online version of the textbook which includes additional figures, tables, and videos to better illustrate diagnostic and therapeutic techniques and procedures in IACC. The third edition of the ESC Textbook of Intensive and Acute Cardiovascular Care will establish a common basis of knowledge and a uniform and improved quality of care across the field.

New sections include a simplified version of the examination suited to inexperienced staff, applicable both for screening and for use in developing countries; a revised proforma that may be used for the follow-up of infants beyond the neonatal period; and a new section describing clinical patterns in newborns with brain lesions and their correlation with imaging and neurological findings. Scoring tables are included in the back of the book.

Neurocritical care monitoring Provides a framework for practitioners who wish to individualize patient care with an emphasis upon the needs of the critically ill brain Discusses the key role of nurses in neuromonitoring and effective bedside training for management and troubleshooting of devices.

*Brain Disorders in Critical Illness* Jaypee Brothers Medical Publishers

Today's APN and PA programs have been allocating less time to the study of neurology, leaving new practitioners with an uncertain grasp of how to approach the neurology patient. Here is a "how to" manual for knowledgeably conducting the basic neurological examination and confidently applying exam findings to the interpretation of common neurologic symptoms. It explains all facets of the standard neuro exam that is conducted in a clinic or hospital setting including useful algorithms. The book then focuses on using the exam results to determine a likely diagnosis and/or area of concern for further diagnostic tests. The text presents both basic and advanced concepts related to the exam to foster a deeper understanding of the meaning and physiology underlying an abnormal finding.

The Neurological Assessment of the Preterm and Full-term Newborn Infant John Wiley & Sons

"NEURO WNL" ("the neurological exam is within normal limits") is commonly the last notation on a physical exam report. Regrettably, this often means that virtually no neuro exam took place. The patient looked O.K. to all superficial appearances and had no particular neurologic complaints. A physician can be trapped into this approach, when there is inadequate time for the 90 minute neurologic exam some references suggest, or even the 20 minute exam suggested for patients with no neurologic complaints. In reality, there are times when 5 minutes or less is available. This book, written for the non-neurologist, focuses on a brief neurologic screening exam that maximizes the useful information obtainable when time is limited. It is not a substitute for the more formal neurologic evaluation that should follow, perhaps by a neurologist, when the screening exam reveals significant findings. A glossary has been included for words not defined in the text. Chapter 1 has been modified from an article by the author in the April 1981 issue of American Family Physician, and contains illustrations by Peter Y. Stone.

Neurological Assessment McGraw-Hill

This highly practical book brings the examination of minor neurological dysfunction developed by Bert Touwen and his colleagues in Groningen right up to date, which is timely in view of the increasing interest in and use of this approach. The approach is a detailed and extensive neurological examination with the aim of detecting a possible neurobiological basis for learning, behavioural and motor coordination problems in a child and thus informing decision-making and management. It provides a refined, sensitive and age-appropriate technique, designed to take into account the developmental aspects of the child's rapidly changing nervous system. This third edition of Bert Touwen's classic handbook has been updated by Mijna Hadders-Algra to reflect contemporary clinical practice. A new chapter assesses the reliability and validity of the methodology, and the book now includes norms for comparison, as well as practical management guidelines based on current clinical practice. Entirely new photographs and diagrams illustrate the assessment techniques clearly. The accompanying CD-ROM contains videos illustrating typical and atypical performance and also provides an electronic assessment form. Readership Paediatric neurologists, physicians working in neuropaediatrics, developmental paediatrics, child and adolescent psychiatry, and paediatric rehabilitation.
